Department of Smart Healthcare Management

Master's Program Year 1

Course Name: **Computer Programming**
Course Code: **M5087**

Date of Assignment:	Year	Month	Day	Date of Submission:	Year	Month	Day
	2026	04	06		2026	03	13

Assignment No : 02
Assignment Title : An Assignment on Python's Function, OOP, Module, File, Exception Handling

Submitted By

Name : Emran Khan
Student ID : 711491135
Program : Master Program in Smart Healthcare Management

Submitted To

Yankuba B. Manga, PhD
Assistant Professor
National Taipei University

Explain how functions, classes, file handling, and exception handling are useful in AI healthcare systems, hospital finance, or management systems.

- ⇨ Functions allow us to wrap complex logic into reusable blocks, making our work much more efficient. Whereas by using classes, we can model real-world data like a patient’s record into organized objects that are easy to manage. File handling ensures our hard work isn't lost, providing a way to save and retrieve reports for long-term use. Finally, exception handling acts as a safety net, catching simple input mistakes before they crash the program. Together, these tools help us build resilient, professional applications. In a single line, mastering functions, classes, file handling, and exception handling is truly transformative for developing reliable systems.
